# Contents

**Preamble: how to use this book** **7**

**1 Producing your first crime map** **9**

1.1 Introduction . . . . . 9
1.2 Geospatial Perspective: key terms and ideas . . . . . 10
1.3 Maps and their types . . . . . 13
1.4 Map projections and geographic coordinate systems . . . . . 13
1.5 Key terms summary . . . . . 15
1.6 Getting started with crime data . . . . . 15
1.7 From dataframes to spatial objects . . . . . 17
1.8 The simple features framework . . . . . 19
1.9 Plotting data with ggplot2 . . . . . 21
1.10 Mapping crime data as points . . . . . 29
1.11 Mapping crime data as polygons . . . . . 31
1.12 Summary and further reading . . . . . 41

**2 Basic geospatial operations in R** **43**

2.1 Introduction . . . . . 43
2.2 Exploring the relationship between alcohol outlets and crime . . 44
2.3 Get the data . . . . . 45
2.4 Attribute operations . . . . . 50
2.5 Spatial operations . . . . . 51
2.6 Plotting interactive maps with leaflet . . . . . 67

2.7 Geocoding . . . . . 72
2.8 Measuring distance more thoroughly . . . . . 75
2.9 Summary and further reading . . . . . 84

**3 Mapping rates and counts** **87**
3.1 Introduction . . . . . 87
3.2 Thematic maps: key terms and ideas . . . . . 88
3.3 Creating proportional symbol maps . . . . . 92
3.4 Mapping rates rather than counts . . . . . 97
3.5 Classification systems for thematic maps . . . . . 103
3.6 Interactive mapping with tmap . . . . . 111
3.7 Smoothing rates: adjusting for small sample noise . . . . . 114
3.8 Summary and further reading . . . . . 121

**4 Variations of thematic mapping** **123**
4.1 Introduction . . . . . 123
4.2 Binning points . . . . . 124
4.3 Transforming polygons . . . . . 135
4.4 Bivariate Maps . . . . . 140
4.5 A note of caution: MAUP . . . . . 147
4.6 Summary and further reading . . . . . 150

**5 Visualisation: good cartographic design** **151**
5.1 Introduction . . . . . 151
5.2 Data representation . . . . . 154
5.3 Colour . . . . . 162
5.4 Text . . . . . 168
5.5 Composition . . . . . 179
5.6 Context . . . . . 184
5.7 Summary and further reading . . . . . 188

**6 Time matters** **191**

6.1 Introduction . . . . . 191

6.2 Temporal data in crime analysis . . . . . 192

6.3 Temporal data wrangling . . . . . 193

6.4 Visualising time data . . . . . 198

6.5 Time series analysis . . . . . 200

6.6 Spatio-temporal data visualisation . . . . . 207

6.7 Summary and further reading . . . . . 263

7. Spatial point patterns of crime events
    I. Mapping crime intensity with isarithmic maps
    II. Burglaries in NYC: introducing `crimedata`
    III. Getting the data into `spatstat`: creating `ppp` objects
    IV. Homogeneous or spatially varying intensity?
    V. Mapping intensity estimates with `spatstat`
        i. Basics of kernel density estimation (KDE)
        ii. Selecting the appropriate bandwith for KDE
        iii. Selecting the smoothing kernel
        iv. Weighted kernel density estimates
        v. Better KDE maps using `leaflet`
        vi. Problems with KDE
        vii. Other packages for KDE
    VI. Summary and further reading
8. Crime along spatial networks
    I. Introduction
    II. Spatial point patterns along networks
        i. Selecting relevant crimes for micro-places
        ii. Assigning (joining) crimes to micro-places
        iii. Calculating a crime rate
    III. Hot Routes
    IV. Quantifying crime concentration at micro-places
        i. Concentration of crime at micro places
        ii. Lorenz Curve
        iii. Gini Index
    V. Street Profile Analysis
        i. Linking data to nodes
        ii. Calculating a rate for nodes
        iii. Visualising crime with Street Profile Analysis
    VI. Summary and further reading
9. Spatial dependence and autocorrelation
    I. Introduction
    II. Exploring spatial dependence in point pattern data
        i. The empirical K function
        ii. Homicide in Buenos Aires
        iii. Estimating and plotting the K-function
    III. Exploring spatial autocorrelation in lattice data
        i. Burglary in Manchester
        ii. What is a neighbour?
        iii. Creating a list of neighbours based on contiguity
        iv. Generating the weight matrix
        v. Spatial weight matrix based on distance
            1. Defining neighbours based on a critical threshold of distance
            2. Using the inverse distance weights
            3. Spatial weight matrix based on k-neighbors
        vi. Choosing the correct matrix
        vii. Measuring global autocorrelation
            1. Moran's I

        2. Geary´s C
    viii. The `rgeoda` package
IV. Further Reading
10. Detecting hot spots and repeats
I. Introduction
    i. Clusters, hot spots of crime, and repeat victimisation
    ii. Burglaries in Manchester
II. Using `raster` micro grid cells to spot hot spots
III. Local Getis-Ord
IV. Local Moran´s I and Moran scatterplot
    i. Computing the local Moran´s I
    ii. Creating a LISA map
V. Local spatial heterokedasticity
VI. Oppenshaw´s GAM and Kulldorf´s Scan Statistic
VII. Assessing clusters with point pattern data
VIII. Exploring repeat victimisation
IX. Further reading
11. Spatial regression models
I. Introduction
II. Challenges for regression with spatial data
III. Fitting a standard regression model with R
IV. Looking at the residuals and testing for spatial autocorrelation in regression
V. Lagrange multipliers
VI. Fitting and interpreting a spatially lagged model
VII. Fitting an interpreting a spatial error model
VIII. The Bayesian alternative
IX. Further reading
12. Modelling spatial heterogeneity
I. Introduction: think of it as interactions
II. Spatial regimes and data partition
III. Geographically weighted regression
